TurboLite Fall Arrester Lifespan

Literature that accompanies the any Product in the Miller TurboLite Webbing Range advises that the lifespan of the units, notwithstanding their subsequent regular inspection and lock testing regime, is given as 10 years. Internationally, this is suggested as a maximum, due to the webbing nature of the lifeline.

In Australia and New Zealand, where our products are conforming/compliant/certified to AS/NZS 1891.3, the units are also governed by the instructions and guidelines in AS/NZS 1891.4 which states the maximum period that period that a unit can run without a Full Service is 5 years.

As the TurboLite units are non-serviceable, by way of a molded sealed riveted casing, a Full Service cannot be performed.

On this basis, it is accepted that the “in service” lifespan of a Webbing TurboLite Fall Arrester is 5 Years.
